Self Comments

Senior iOS engineer with 13+ years of experience shipping consumer-facing apps in Swift, SwiftUI, and Objective-C.

Currently tech lead of the Discover Squad at Nike China — adapting a global consumer product for the Greater China market, owning the core browse, search, and product-detail surfaces (PDP, ShopHome, Discover, Product Wall), and partnering daily with a globally distributed engineering team to ship locale-aware, market-specific features at scale.

Comfortable with end-to-end ownership — translating ambiguous product requirements into tech designs, driving cross-functional execution, mentoring engineers through code reviews and pairing, and shipping pixel-perfect UI with fluid animations.

Pragmatic about building reusable foundations (networking, logging, routing, modular components) and an early adopter of AI-powered development tools (Claude Code, Cursor) — extending them across tech design, code generation, debugging, and review workflows, and even to cross-stack contributions on the Android side of the same product.

Education Background

- **Zhejiang Gongshang University, China** — BSc in Network Engineering, 2010

Language Ability

English (Working Proficiency), Mandarin Chinese (Native), Cantonese (Conversational)

Working Experience

Jan. 2021 – Present Nike China, Senior iOS Software Engineer / Discover Squad Tech Lead (Shanghai, China) *(Converted from contractor to full-time in Mar. 2022)*

- Tech lead of the **Discover Squad** (5 → 14 engineers across iOS and Android) — **adapting the global Nike App for the Greater China market**, owning **PDP**, ShopHome, Discover, and Product Wall (the core browse, search, and product-detail surfaces).
- Architected the **GC PDP Feature** — a half-year initiative to build a configurable, modular **product detail page** that serves as the foundation for all Greater China product content; partnered with the **Global PDP team** to align on data contracts, UX patterns, and roadmap.
- Partner daily with the **Global Discover team** on roadmap alignment, dependency management, and feature integration across distributed time zones — primary working language English.
- Translate ambiguous product requirements into sprint-sized tickets with LOE estimates and milestones, and coordinate **feature-flag-based gradual rollouts** with PM, PMO, and Release Manager.
- Led the **Size Picker 6.0.0** refactor — full UIKit → **SwiftUI** migration with custom transitions, delivering **pixel-perfect UI and fluid animations** across device classes while removing legacy dependencies.
- Drove the **SNKRS China C4C (Core for China)** architecture migration — decoupled services into reusable capabilities and overhauled the **StreamClient (networking + logging) module**, a foundational component shared across the app.
- Mentor engineers through code reviews, tech design reviews, and pairing; raise the engineering bar on testability, modularization, and rollout safety.
- Integrate **AI-assisted tooling (Claude Code, Cursor)** into the team's daily workflow — tech design, code generation, debugging, refactors, and review — and share patterns across the squad.
- Extended AI-assisted development across platforms — used **Cursor** to make **cross-stack contributions on the Discover product's Android codebase**, unblocking parity work outside my primary iOS stack.
- Contributed **250+ PRs across 25+ repositories** over 5 years, spanning Nike App China, SNKRS China, and Mamba.

Apr. 2018 – Dec. 2019

[Square Valley](#), Senior iOS Software Engineer (Shanghai, China)

- Built **18Birdies** — a global consumer-facing golf iOS app in Swift, delivering tee-time **booking / checkout**, GPS rangefinder, and scorecard features to users worldwide.
- Designed and developed the **Tee Time Booking** module end-to-end, including a custom calendar UI, **fluid animated transitions**, and third-party API integration.
- Bridged gaps between the third-party booking API and product requirements — shipped the **Modify Reservation** feature with no upstream API support via careful local state management.
- Incrementally added “Buy 9 Get 1 Free” promotions and coupon discounts to the booking flow with minimal changes to the existing codebase.

Nov. 2015 – Apr. 2018

[Anjuke Inc.](#), Senior iOS Software Engineer (Shanghai, China)

- Maintained and iterated on the **Anjuke Broker** app (Objective-C), serving tens of thousands of real-estate agents across the 58/Anjuke/Ganji platform.
- Led the development and release of the **Jikejia** iOS app for property management and multi-channel listing.
- Built a shared **networking + logging layer** on top of AFNetworking, adopted across the iOS team to standardize API calls, error handling, and telemetry — foundational infrastructure still in use long after I left.
- Implemented a **URL-based Router** in Jikejia and promoted it to other projects, enabling decoupled navigation and cross-module communication.
- Designed a flexible **ListAdapter**-style architecture for Jikejia’s property publishing pages, supporting diverse layouts with a single data-driven pattern.
- Drove **modularization** efforts within the iOS team, splitting monolithic code into reusable components.

Jun. 2012 – Oct. 2015

[KKTv](#), iOS Software Engineer (Hangzhou, China)

- Joined as an early-stage employee and contributed to the full lifecycle of the KKTv live-streaming iOS app — from initial feature development through iteration and App Store releases.

- Jan. 2010 – Jun. 2012

ArcSoft, QA Engineer (Hangzhou, China)

 - Conducted image-processing algorithm testing, authored test cases, executed test plans, and delivered detailed reports to the development team.

Specialty

Swift, SwiftUI, UIKit, Core Animation & Core Graphics

iOS Architecture & Performance

Building for Global Markets & Locale-Aware Product

Cross-Region Engineering Collaboration

AI-Assisted Development (Claude Code, Cursor)
